

# Options Trading Bot with Cloud-Based Infrastructure

Cornell Data Science  
Algorithmic Trading

# Strategy

# Basic Options

a contract that gives the right, but not the obligation, to buy or sell the underlying asset at a specified price and quantity

strike: the specified price you can buy or sell the equities at

expiration date: date when you can choose to exercise option

premium: the money you pay for the options contract, a fee

# Long Call vs Long Put

Gives the right to buy at strike

Gives the right to sell at strike

# Strategy: Long Straddle

- Buy long call and put at same strike and expiry
- Doesn't matter which direction price swings to
- Idea: capture market reaction to news
- Conjecture: stocks with more intense sentiment will swing more and make it likelier to break-even

✓ Long Straddle

# Part I: Scraping

- Wrote code for scraping news utilizing mainly BeautifulSoup for article source
- Utilized Beautifulsoup module for parsing
- Thought needed for type of RSS feeds used
- Outputted dictionary with tickers as key and the value as tuple with published date and article headline

# Part II: Sentiment Analysis

- Trial and error with many pretrained sentiment models
  - Vader: social media posts oriented
  - TextBlob: didn't agree with the numbers
- Eventually decided on Hugging Face's model
- Decision on whether it has extreme sentiment or not
  - Number of headlines: affect audience reach
  - Sentiment score output of the model
  - Take the product to interrelate two values (sum doesn't provide as much scaling, ends up same as just taking number of headlines)

# Backtest Result

- Hypothesis somewhat correct
- Higher products have higher "spreads" of daily price change, implying greater chance of greater movements in prices

# Part III: Buy

- Pulled live options data from yfinance
- yfinance only produce either a list of calls or puts
  - paired calls and puts with the same expiration dates and strike prices to create a straddle
- Picked the straddle (call and put pair) with closest expiration to make it easier to keep track of the results
- Chose a straddle with minimum premium

```

# Infrastructure Team

Jack, Uday, Rohan, Rucha

# Goal

Create a scalable and reliable cloud-based infrastructure for the trading bot

# Why use the Cloud?

## 1. Automated Infrastructure

- Fully managed servers / databases
- AWS CDK/Infrastructure as Code (IaC) - spin up everything with one command.

## 2. Scalability

- AWS Lambda/EC2 provide autoscaling (i.e. more instances are automatically created to handle higher load).

## 3. On-Demand Resources

- Save money by not having extra instances run all the time
- Scale up/down when you need to

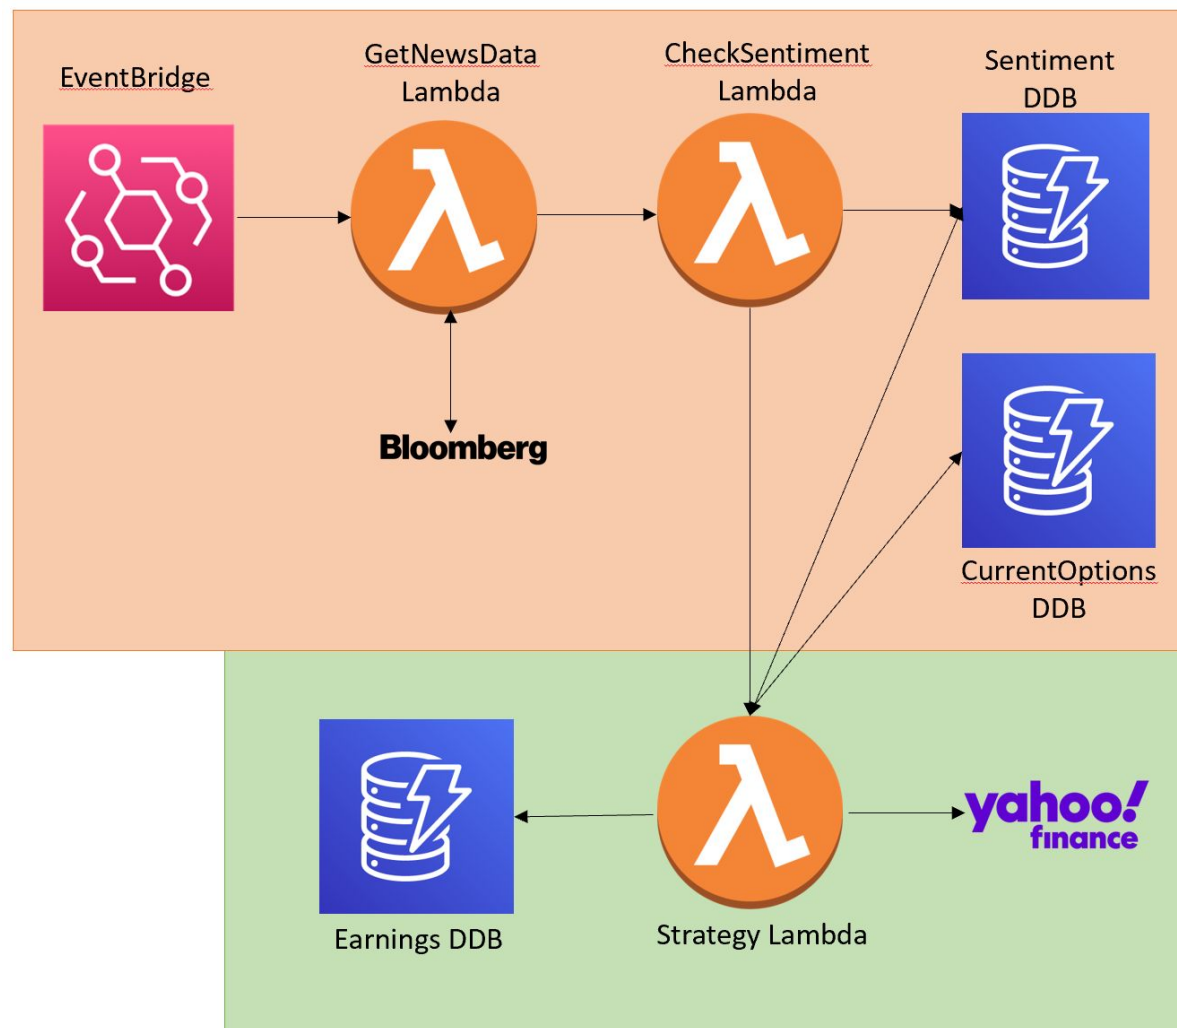

# Technologies/AWS Services Used

- Amazon Web Services - cloud service provider
- AWS Lambda
- Docker
- AWS DynamoDB
- AWS Step Functions
- AWS CDK

# Trading Bot System Architecture

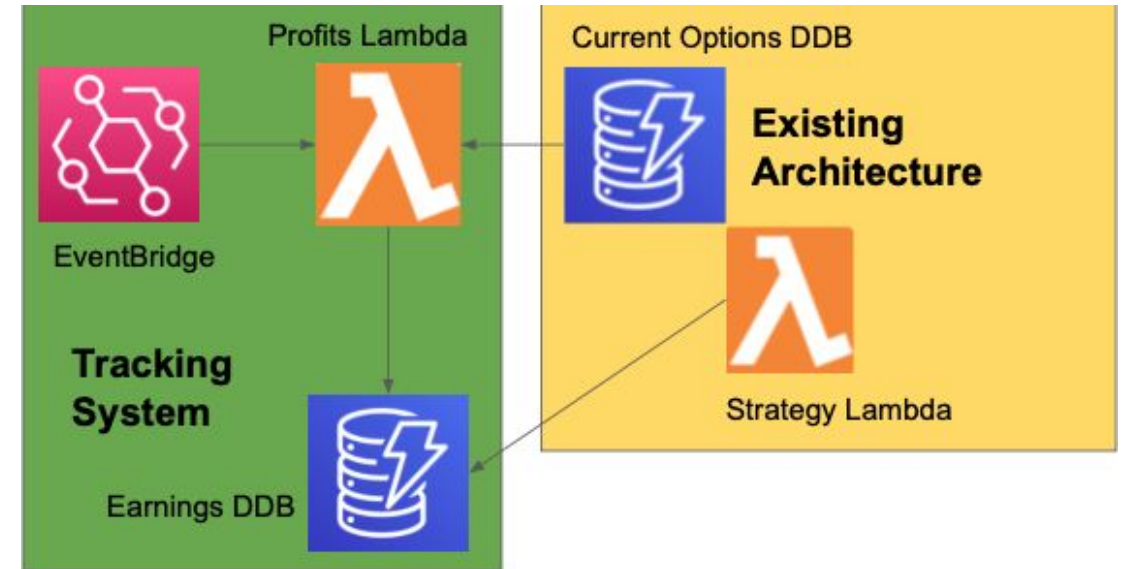

# Demo

# Calculating Profit and Tracking Money

1. Separate “Earnings” database that acts as a ledger for all option transactions, and stores the current balance
2. With each transaction (e.g. call/put contract purchase), the balance is updated
3. At the end of each market day, an event bridge calls a lambda function to find expiring contracts, calculate the profit (if applicable), and record it in our ledger

# Back to the Demo

# Future Work/Possible Extensions

1. Real time testing
2. Alternative trading strategies which could fit in our already defined architecture and sentiment analysis
3. Scale up cloud infrastructure to handle more heavy or more frequent requests to execute trades
  - a. Data streams
  - b. Concurrent trades
4. Using alternative APIs
  - a. Weren't able to get IBKR (Interactive Brokers) to work initially, so had to pivot

Thank you!
